

MARS CORRECT? MARS IS WET!

Critique of All NASA Mars Weather Data

By Barry S. Roffman,
Lieutenant, USCG-Retired

Technical advice by Dr. David A. Roffman (PhD, physics)

Updated January 29, 2017

Why go to or care about Mars?

Many think life started on Mars, came here via meteorites

- ❑ An asteroid or comet probably wiped out dinosaurs here.
- ❑ We have all our survival “eggs” in 1 basket (Earth).
- ❑ **Mars has natural resources including running water.** It once had oceans.
- ❑ **Viking 1 and 2 found evidence that it has life.**

Photos taken by Mars Science Laboratory on its sols 1185 and 1189 might show spherical life forms on Mars

SOL 1185 anomaly - mars... 1185MR0053760000602491... ANOMALIES AT MSL ON ITS SOL 1,185.
OBJECT SIZES ~ 0.5 TO 0.75 CM. FOUND BY DAVID KIEPKE.

Sufficient air pressure is essential for life. We dispute NASA's 6.1 mbar Mars areoid pressure.

- **Areoid is Mars equivalent of Sea Level.**

- **Average Earth sea level pressure = 1,013.25 Mbar.**

- **6.1 Mbar is nearly a vacuum – no fun to experience.**

Why Question Pressure?

Running water isn't likely to be found on the surface of a planet with a near-vacuum surface. Water would boil off too fast. But Mars has thousands of these streams.

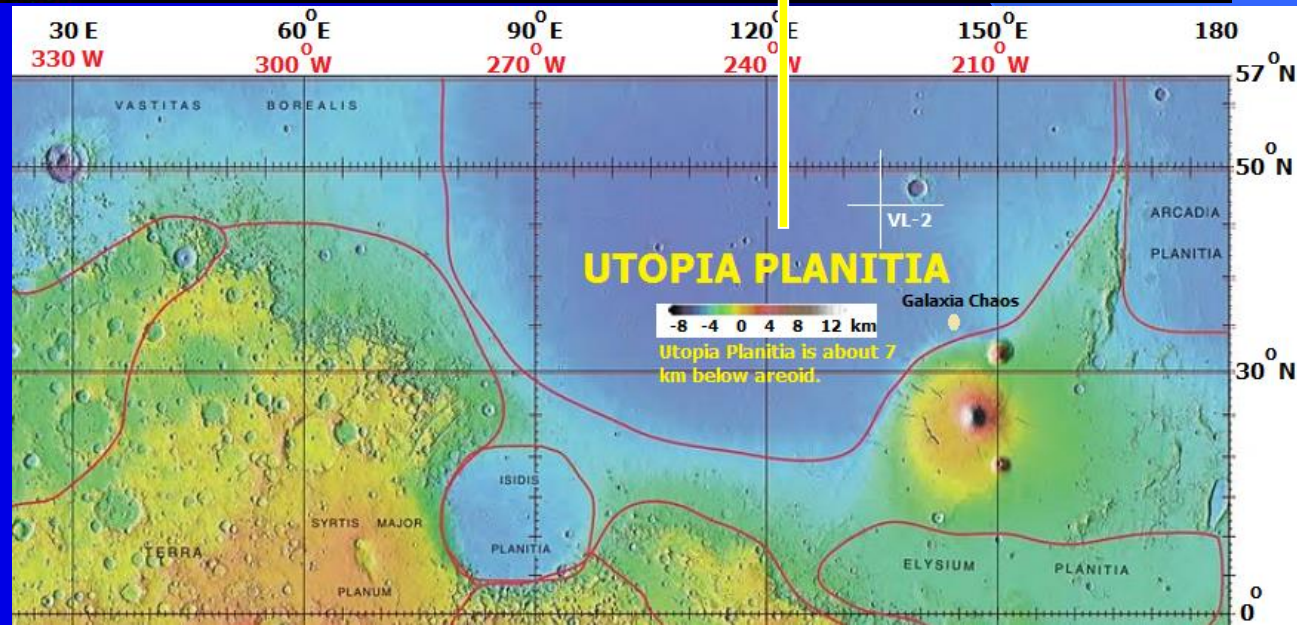

Palikir Crater inside Newton Crater

Surface water is associated with Recurring Slope Lineae (RSL). Where are they on Mars?

Location of RSL on Mars

There is also a frozen sea at Utopia Planitia. It has the volume of Lake Superior on Earth.

Estimated Boiling Points for Places Where There Is Running Water On Mars

Luju Ojha *proved* running water on Mars is linked to perchlorate salts. They should raise boiling points and lower freezing points on Mars.

But water found on Mars matches what is expected for pure water there, not salty water.

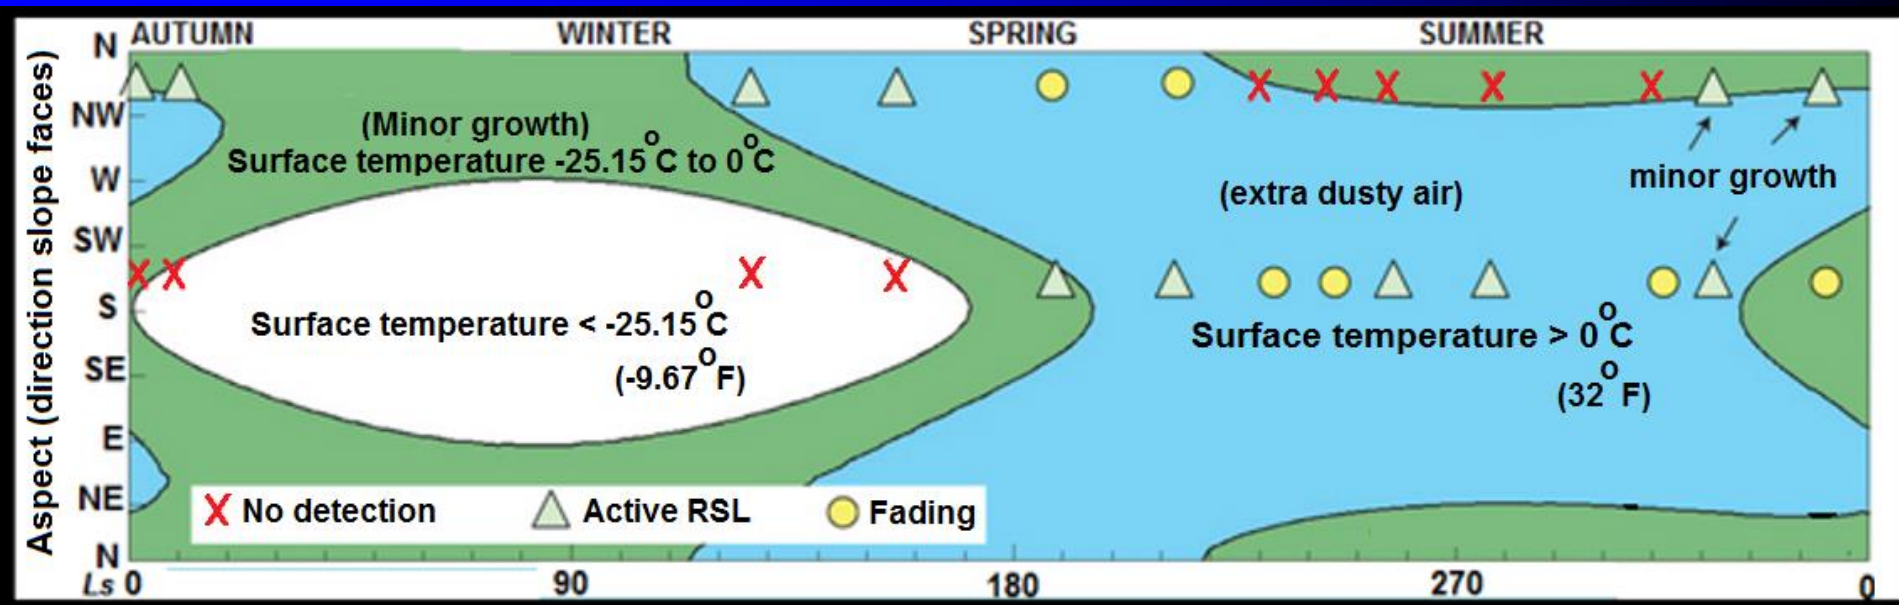

Luju Ojha
Georgia Institute of Technology
Ph.D. Candidate

What temperatures are associated with RSL?

9

- Generally close to or above the freezing point of water (0° C) on Earth.
- Where below 0° C perchlorate salts allow for lower freezing points (but this seems rare).

9

Martian Sky Color is an Issue.

In the Moon's vacuum the sky is black.

© James Clash

At high altitudes over Earth, like 83,600 feet, (with 11.3 mbar) our sky goes black.

**Why is the Martian sky so bright with under 10 mbar pressure
What color really is it anyway?**

Original color seen.

Sky color after order to alter color monitors by NASA Administrator Dr. James Fletcher.

Sky color seen at Viking 1 in 1976 - before and after alteration

Sky color at MSL in 2012

100 m

Initial Cause to Question Accepted Pressure

- **Dust devils on Mars and Earth are similar.**
(timing, electricity, core temperature rises, and often size but they can be much bigger on Mars)

Mars: http://mars.nasa.gov/mer/gallery/press/spirit/20050819a/dd_enhanced_568b-B558R1.gif

Earth

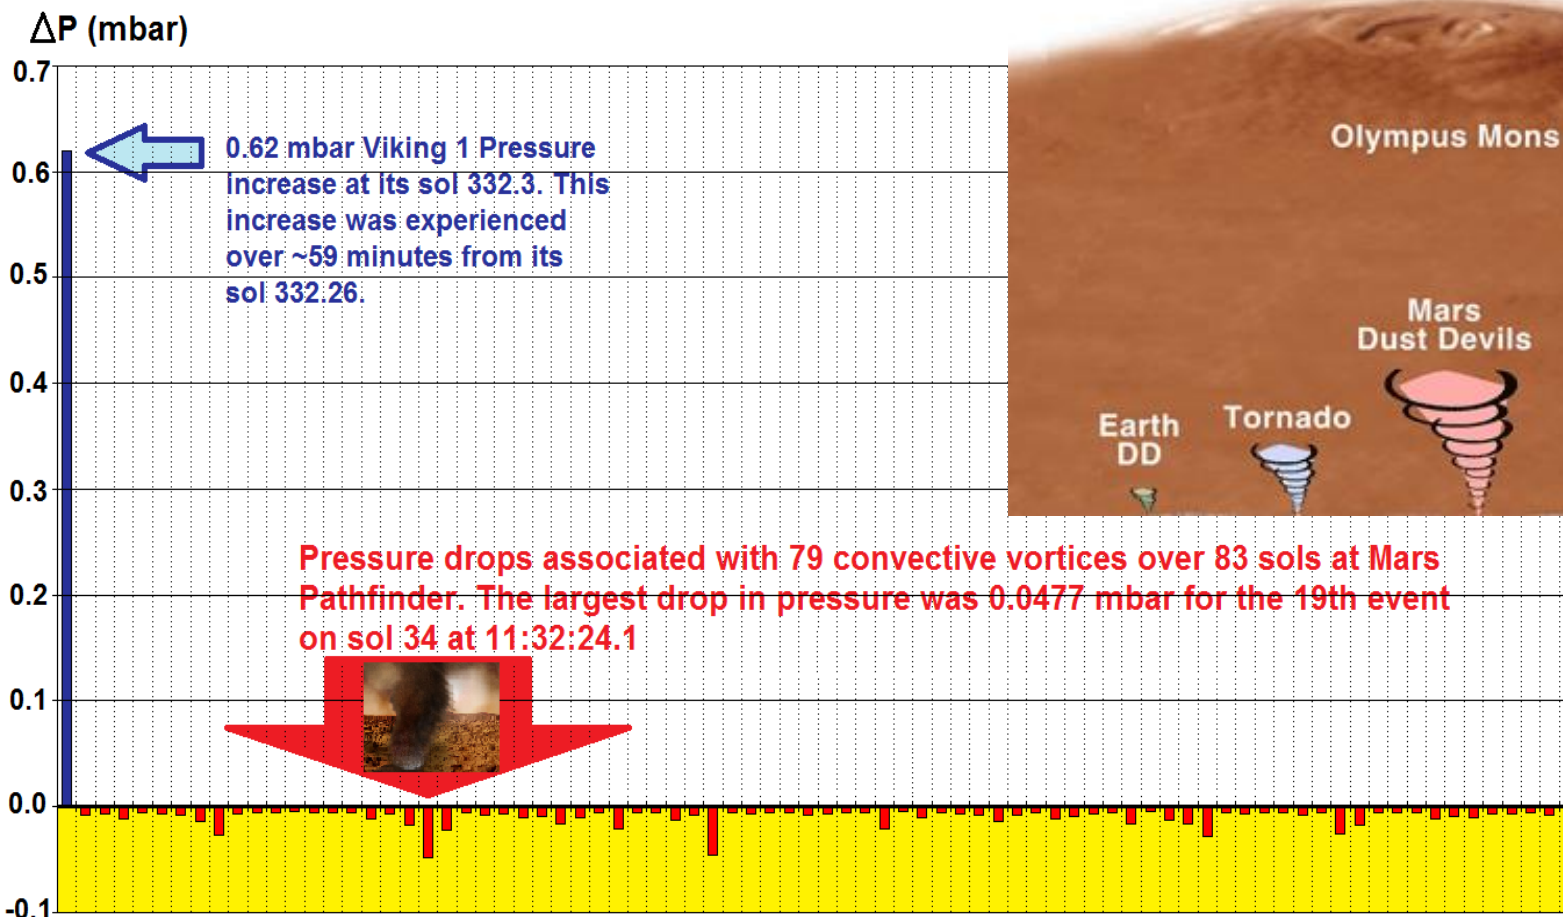

Similar dust particle size (.001 mm). But at 6.1 mbar pressure, an impossible 1,118 MPH wind is required to lift dust.

DUST DEVILS ARE THE MOST OBVIOUS WEATHER ODDITY

With so little air on Mars, how can there be enough change in pressure to form them at all?

Why Question Pressure?

Dust devils even form at a height of 10.6 miles (17 km) on the Arsia Mons mountain where pressure should only be 1/1000 th of Earth's pressure.

Why Question Pressure?

Dust storms increase air pressure and can block 99% of light on Mars (and Earth).

Mars_dust_opacities_MER-B_Sol_1205_to_1235.jpg (800 × 533 pixels, file size: 39 KB, MIME type: image/jpeg)

Phoenix, AZ Dust Storm of 5 July 2011

- Pressure increased by 6.6 mbar – that's more than average 6.1 mbar pressure on Mars.

- Pressure measured on MSL was at least 9.25 mbar. That + 6.6 mbar = 15.85 mbar. **MSL can't even measure over 11.5 mbar.**

Why Question Pressure?

- Snow on Mars with ice particles in clouds ten times too small for accepted pressure.

Spiral Clouds on Arsia Mons look like Hurricane Eye Walls. 1 mbar NASA claim seems too low.

Eye
wall
~6.25
Miles

These clouds go up 18.75 miles above Arsia Mons. Believe NASA, and pressure there is only $\sim .07$ Mbar – too low to support such weather.

STRATUS CLOUDS 16 KM ABOVE MARS SUGGEST A PRESSURE AT AREOID OF 511 MBAR AND AT HELLIS BASIN HIGHER THAN PRESSURES ON EARTH AT SEA LEVEL.

1. CIRROSTRATUS CLOUDS ARE FOUND ON EARTH UP TO 13,000 METERS HIGH.

Meteorology Calculator Version 1.5.9			
Pressure Altitude Required Data Entry

Often MSL pressures were well above the expected curve.

When we pointed them out to NASA, NASA dropped them back to the curve.

On Sol 369 pressure was 865 Pascals (8.65 mbar). The next day a record high of 1149 Pa was recorded - the most the sensor could measure. We called JPL. The next day it was back to 865 Pa.

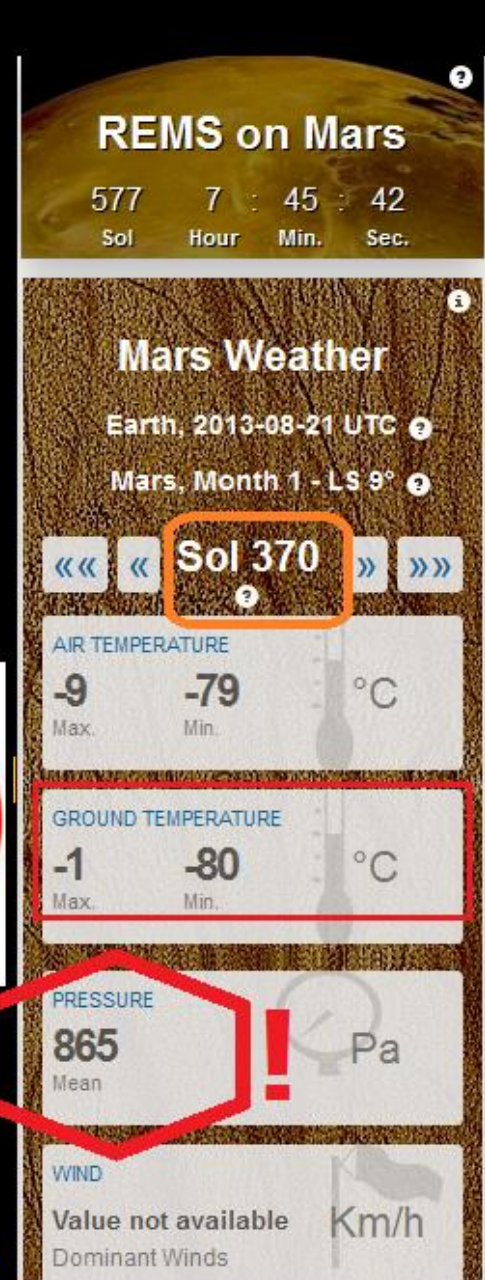

REMS Team/ NASA/JPL Critical Data changes After Hearing from the Roffman Mars Correct Team.

**Pressure reported
as 1149 Pa BEFORE
we brought it to
JPL's attention.**

**About 7 months after we
brought the 1149 Pa pressure to
JPL's attention, they changed it to
865 Pa!**

**898 Pa
is normal
pressure
on
Sol 1159**

**1,177 Pa is
higher than
sensor
capabaility on
Sol 1,160**

**1,200 Pa
is higher
still on
Sol 1,161**

**897 Pa is
back to
normal on
Sol 1,162**

**NASA later
altered
1177 Pa to
899 Pa and
1200 Pa to
898 Pa.**

Once again we force NASA to reduce high pressures on Sols 1300 and 1301

Pressure was 753 Pa and falling on Sol 1299. It was 751 on Sol 1302. So when challenged, JPL/REMS reduced high values for Sols 1300 (945 Pa) and 1301 (1,154 Pa) to an intermediate value of 752 Pa.

After we pointed out unusually high pressures for sols 1300 and 1301 JPL/REMS reduced them. 945 Pa on Sol 1300 was dropped to 752 Pa. →

1154 Pa on Sol 1301 was reduced to 752 Pa. →

Viking pressure spikes at 6:30 to 7:30 am were evidence for internal (heater-related) processes at work. Thus they were **not** measuring outside air pressure!

VIKING 1 PRESSURE CHANGES ON ITS 305TH TO 350TH DAYS

PRESSURE
CHANGE MBAR

PRESSURE CHANGE 6:30 AM TO 7:30 AM MARS TIME

PRESSURE CHANGE 7:30 AM TO 8:30 AM MARS TIME

0.62 MBAR INCREASE

TINY DUST FILTERS HAD NO CLEANING MECHANISM

Mars is very dusty. All dust filters likely clogged immediately on landing.

DIME SURFACE
AREA = $\sim 251.9 \text{ mm}^2$

TAVIS DUST FILTER FOR VIKING = $\sim 40 \text{ mm}^2$ ●

TAVIS DUST FILTER FOR PATHFINDER = $\sim 3.14 \text{ mm}^2$ ●

VAISALA DUST FILTER FOR PHOENIX OR MSL = $\sim 10 \text{ mm}^2$ ●

Viking Pressures & Outside Temperature

Pressure varied inversely with outside temperature. This suggests heating of the gas behind a dust clot that isolated the pressure sensor from Martian air.

 <http://www.1728.com/gaspres.htm>

VIKING 1 YEAR 1

solve for:

$$\frac{P_1}{T_1} = \frac{P_2}{T_2}$$

Temperature 1 Equals >> VL1 SOL 292.96, Ls 260.849

Temperature 2 Equals >> VL1 SOL 102.5, Ls 146.385

Pressure 1 Equals >> VL1 SOL 110.66 (and others), Ls 150.662

Pressure 2 Equals >>>>

ACTUAL VL1 MAX PRESSURE = 9.57 MBAR
AT SOL 318.34, Ls 277.724 (98.19% OF PREDICTED VALUE)

Note: 177.19 K = -137.128° F
255.77 K = +0.716° F

Evidence for clogged dust filters: Viking pressure data for over a Martian year

Figures 9A and 9C show that as temperature fell pressure recorded rose.

Figure 9B is 9C inverted to show quality of pressure and temperature link.

Hypothesis: Above annual trend will be matched at the hourly level when RTG heaters are on & increasing pressure behind a dust clot.

Initial MSL daily pressure also varied inversely with outside temperature. This reinforces the dust clot idea.

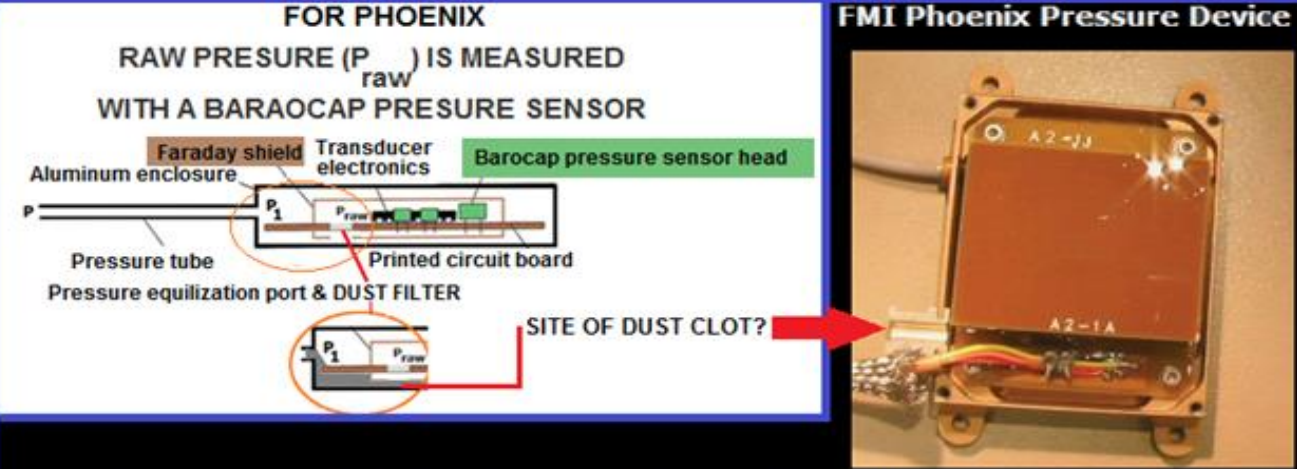

ARE DAILY PRESSURE CYCLES RELATED TO THE INVERSE OF TEMPERATURES OUTSIDE THE MSL AS WITH VIKINGS?

FMI knew it had a problem with Phoenix

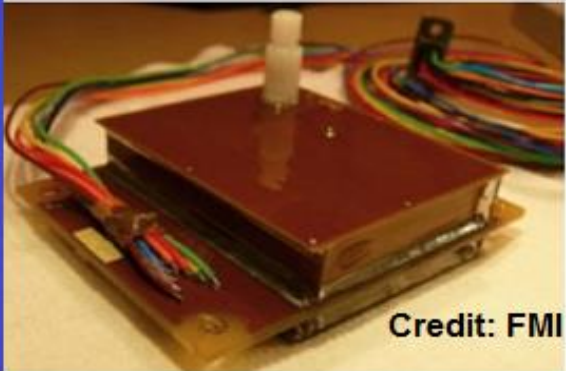

FOR PHOENIX

RAW PRESURE (P_{raw}) IS MEASURED
WITH A BAROACAP PRESURE SENSOR

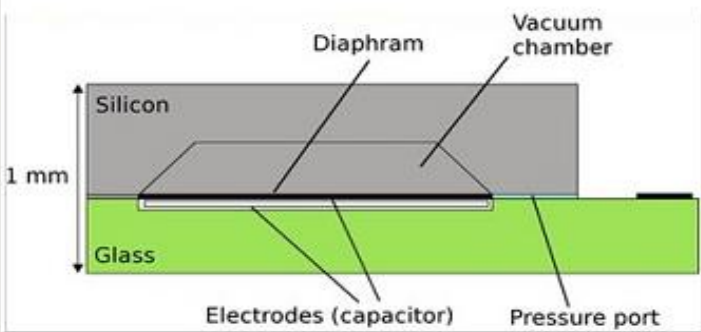

Pressure device is small and light weighted pressure sensing instrument. The main dimensions of the device are approximately 55x45x20 mm and the weight is less than 30 grams.

MSL Vaisala Transducer

Credit: FMI

In 2009 they wrote, ***"We should find out how the pressure tube is mounted in the spacecraft and if there are additional filters etc."*** FMI designed the sensor.

KENRIK KAHANPÄÄ: MAN AT THE CENTER OF PHOENIX AND MSL PRESSURE CONTROVERSY

*"That we at FMI did not know how our sensor was mounted in the spacecraft and how many filters there were shows that **the exchange of information between NASA and the foreign subcontractors did not work optimally in this mission!**"*

(Kahanpää [FMI]
Personal communication,
December 15, 2009)

International Traffic in Arms Regulations (ITAR)

- *"After Phoenix landed... the actual thermal environment was worse than the expected worse case... **Information on re-location of the heat source had not been provided due to ITAR restrictions.**"* (Taylor, P.A., et al, 2009)

Occam's Razor

The simplest solution is usually correct.

This suggests repeatable pressure data should be believed. But, consistent pressures measured by all landers may only exist because they all had pressure sensor air access tubes clog in similar fashion (or because, as was just shown, the data has been altered).

Red boxes show pressures each day that were within 2% of our predictions based a formula that presumed dust clots. 0.3 = 6:30 am to 7:30 am

Why Trash Occam?

Moving Sand Dunes on Mars.

"Mars either has more gusts of wind than we knew about before, or the winds are capable of transporting more sand."

Nathan Bridges,
Planetary scientist, Johns Hopkins University's Applied
Physics Laboratory

Why Trash Occam?

- Wind-tunnel trials show a patch of sand would take wind 80 mph to move on Mars (vs. 10 mph on Earth). No lander ever saw wind so high on Mars.

JPL: Spirit rover detected shifting sand in 2004.

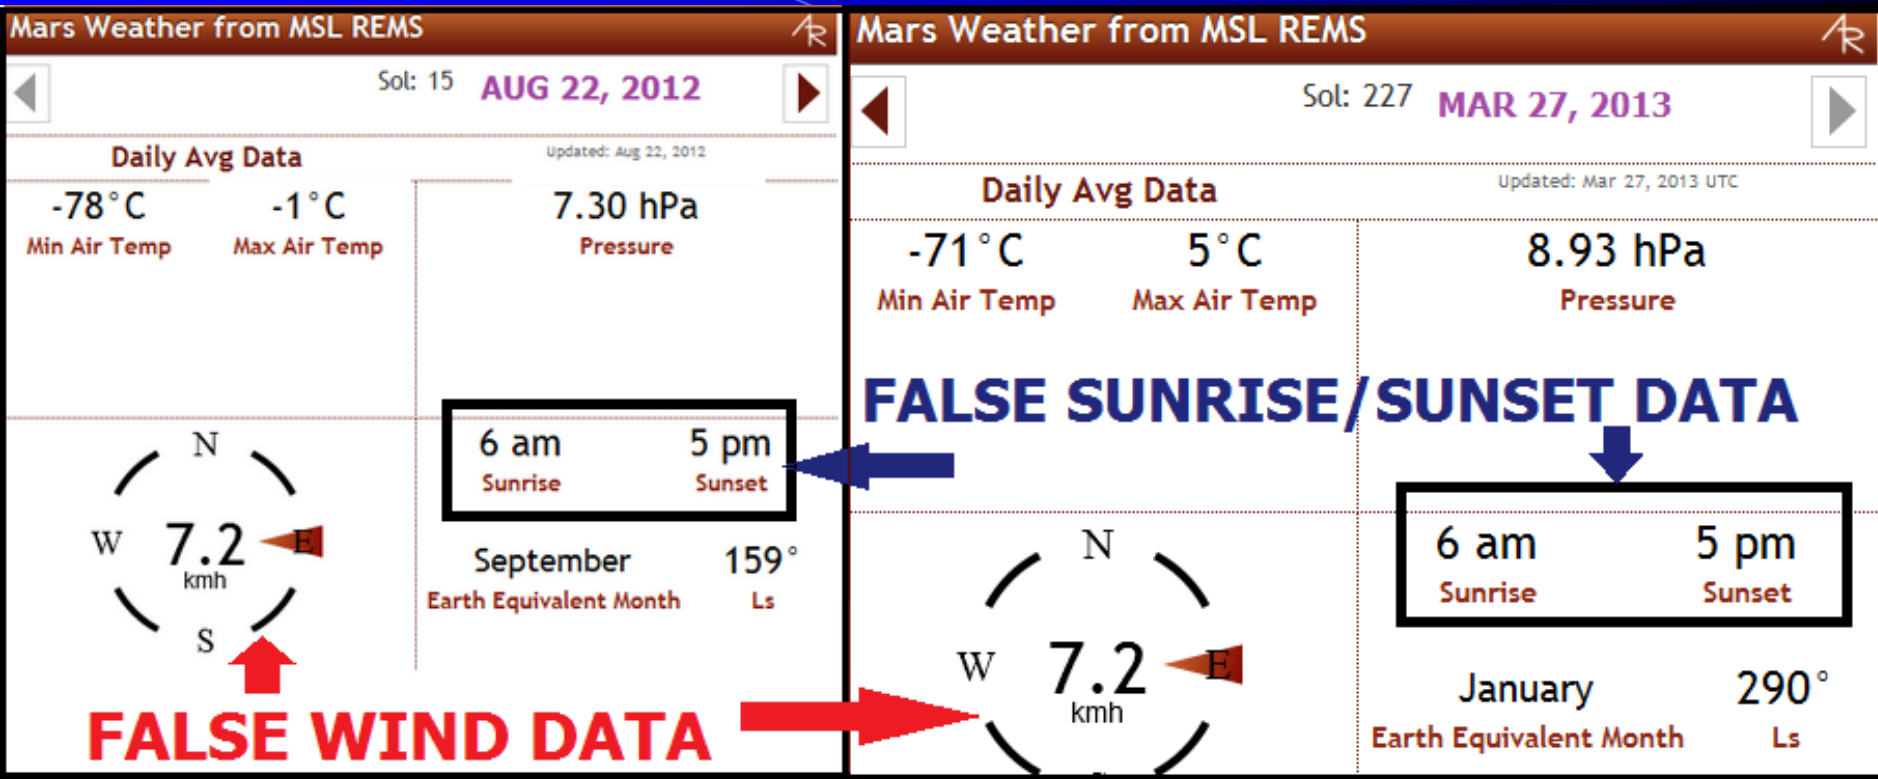

- **Rovers' track marks filling in with sand.**

Viking wind never reached 80 mph needed to move sand at low pressure. Highest wind? 57.9 mph. As sand does move, pressure MUST be higher.

Data Reporting Fiasco

From August 22, 2012 until April 2, 2013 ALL wind data published by REMS and Ashima Research was wrong. All sunset/sunset times were also wrong.

We told JPL that there could not be only 11 hours of daylight at MSL. David Roffman did the math. There is as much as 12 hours 19 minutes of daylight and little as 11 hours 43 minutes. NASA accepted the fix.

**Best estimate of the
length of daylight at
MSL (4.59 South on Mars)**

One of the REMS Booms broke on Landing. It would have been more honest to list winds as *Not Available*.

We know from the Vikings that there is an enormous amount of variation in winds.

VL-1 SOL	LS	Wind direction	Wind Speed M/S	Wind Speed MPH
214.38	210.621	290	1.2	2.68
214.42	210.646	249	2.6	5.82

Profile of the windiest Viking day on Mars with the greatest wind gust recorded at VL-1 sol 214.78.

BOGUS GROUND TEMPERATURES?

Boom 1 broke. It alone measures ground temperature but with accuracy of only 18 Fahrenheit.

REMS Block Diagram

GROUND AND AIR TEMPERATURE SENSOR

Guy Webster (JPL) claims: "Damage on landing did not include the Infrared sensor that provides ground-temp information." But an accuracy of 18 degrees Fahrenheit is almost worthless.

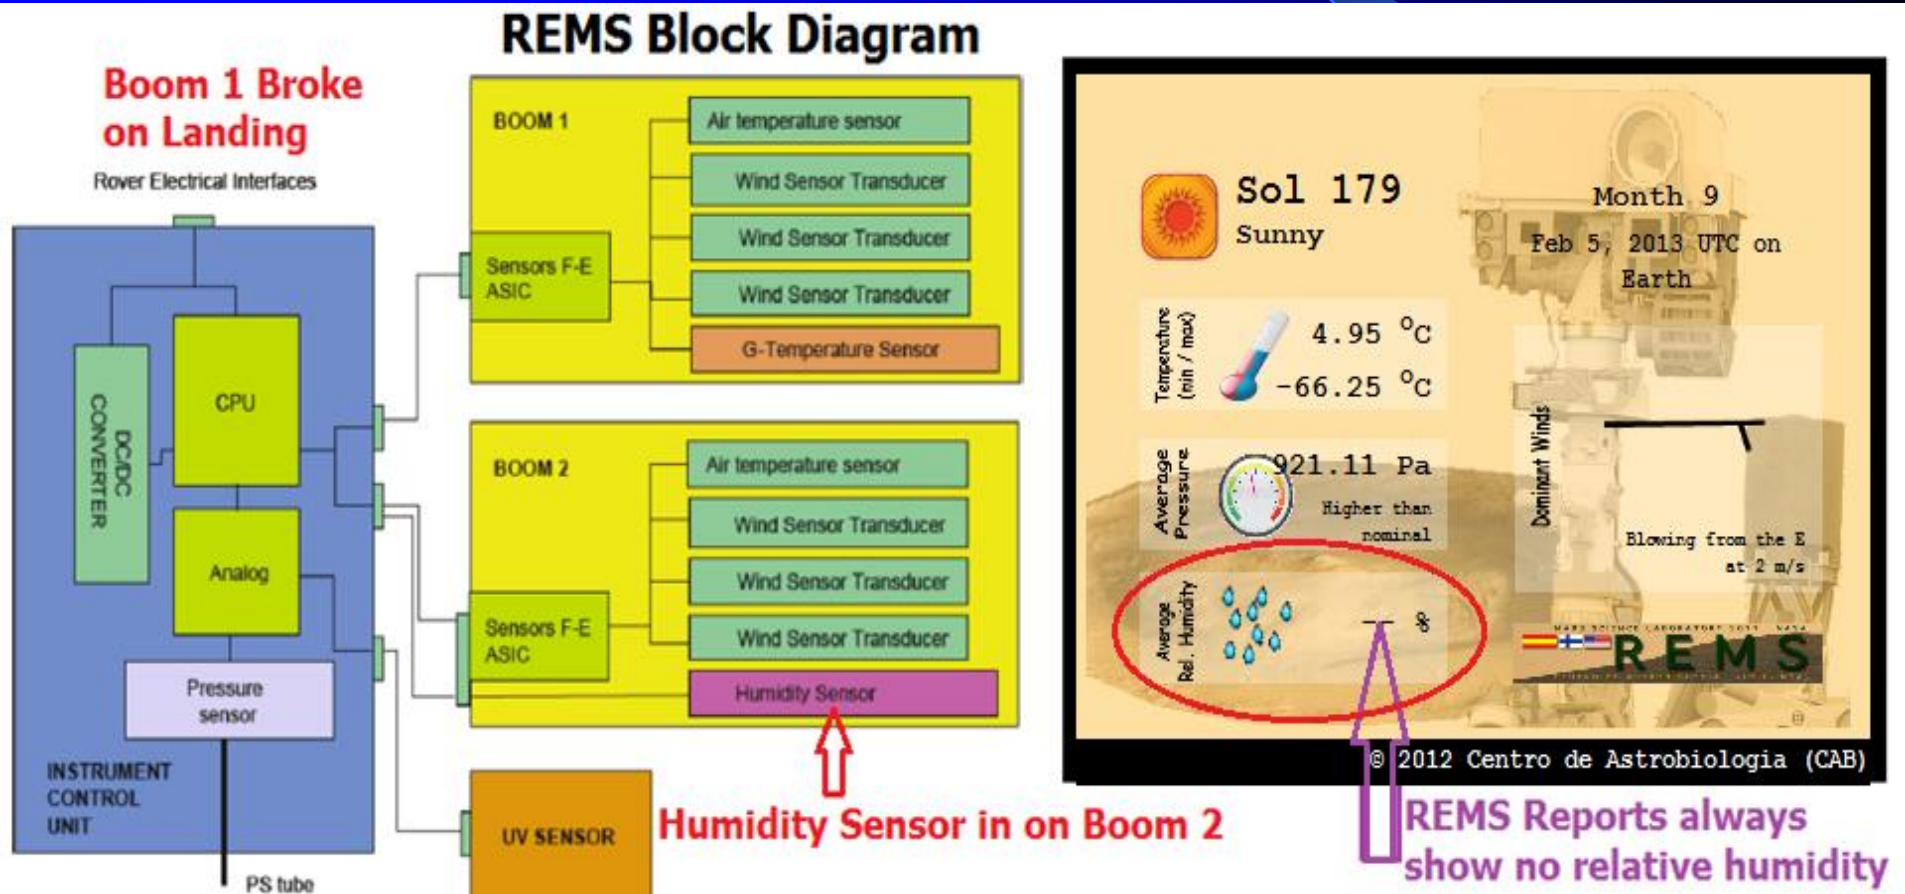

But the weak ground temperature answer did not address altered air temperatures. Who is killing warm days on Mars, and why?

A	B	C	D	A	B	C	D

REMS Relative Humidity Sensor

Only Boom 1 broke on Landing. Why no relative humidity reported from Boom 2? Calibration problems with the Thermal and Electrical Conductivity Probe?

G.M. Martinez et al., 2013

The REMS Team leaves Relative Humidity off daily reports, but published this on 6/27/2013:

REMS Asserts Huge Changes in Relative Humidity Over Very Short Distances

← mars.jpl.nasa.gov/msl/images/MSL_TraverseMap_Sol0313_fcalef-br2.jpg

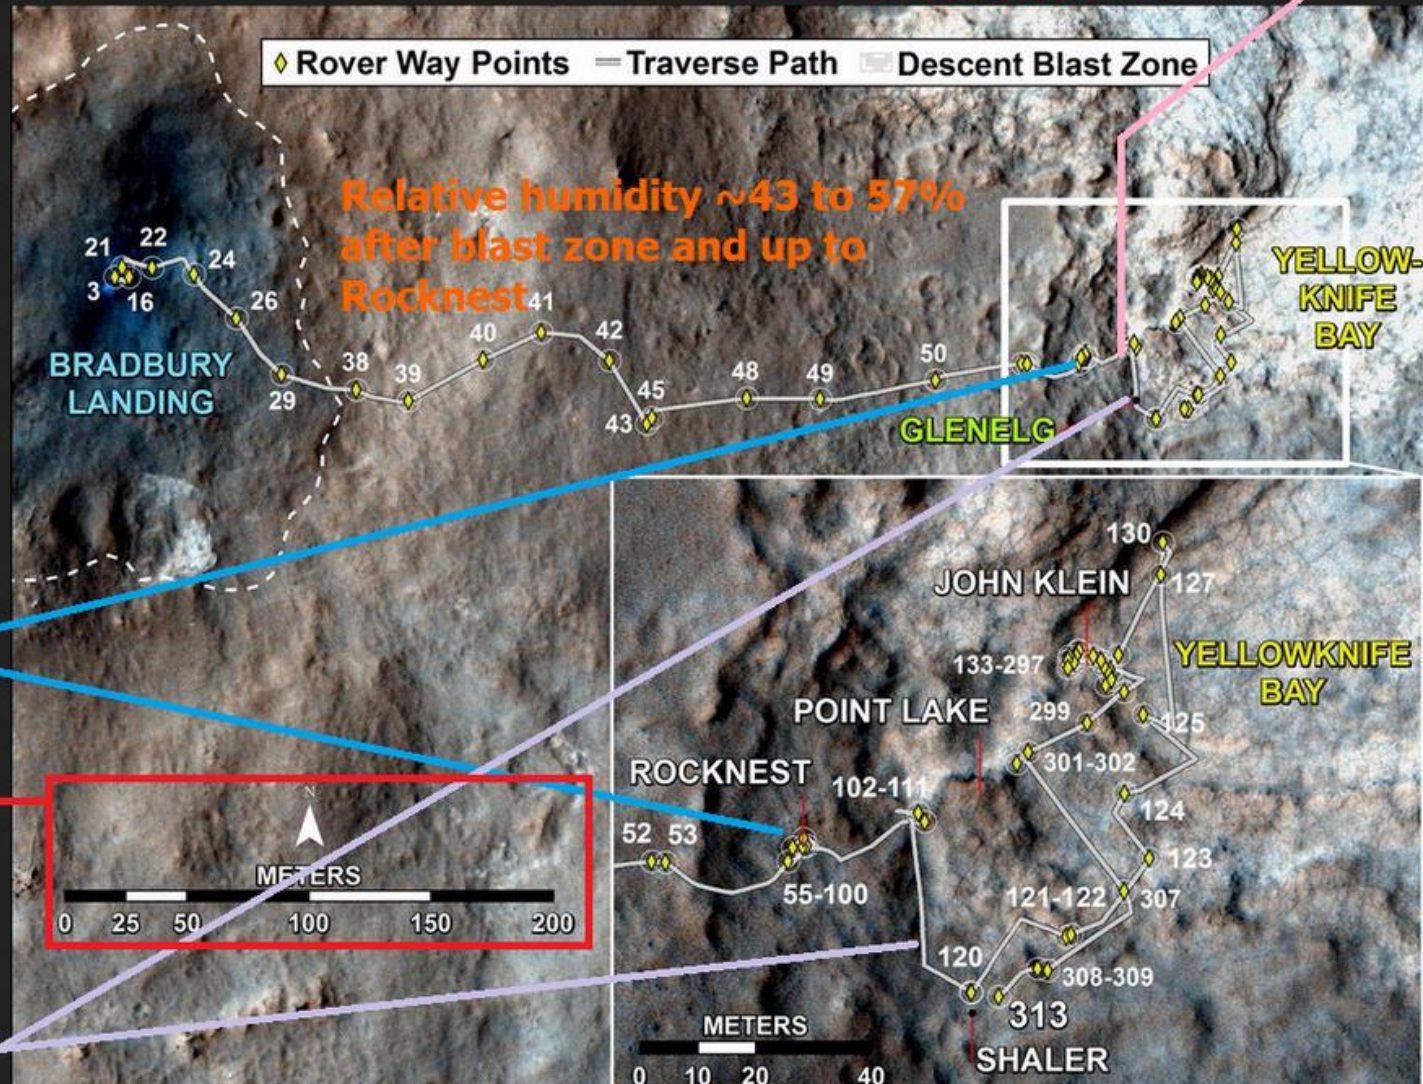

Between Rocknest & Glenelg RH was about 6 to 9%.

Relative humidity = ~40 to 60% in landing blast zone.

At Rocknest relative humidity drops from about 58% to ~9 % over 50 sols.

Note distance scale. Changes in RH over ~400 m.

At Glenelg RH varies from about 6% to 17%.

If temperature and pressure measurements are wrong, as shown earlier, RELATIVE HUMIDITY READINGS WILL BE WRONG TOO.

- September 26, 2013 JPL announces there are 2 pints of water in every cubic foot of soil. If pressure was as low as NASA claims, water should have evaporated out of the soil, not absorbed it from the atmosphere.

(Note: NASA claims about perchlorates and deliquescence are discussed at slides 5 to 9 and at http://marscorrect.com/photo5_9.html).

Early Problems with MSL Weather Reports

1. Sunrise/Sunset times wrong until May, 2013.
2. Constant winds wrong.
3. Relative Humidity always missing.
4. Day numbering wrong & temperatures revised.
5. Early wrong month labeling = wrong place in orbit & wrong distance from the sun.
6. Exact ground temperatures issued when accuracy (18° F) was worthless.
7. Wrong pressure units used or pressures off the curve from 2012 to 2015.

Data Reporting Fiasco

REMS Reported 6 Days of Earth-like Pressure

PRESSURE REPORTED INCREASED 100 FOLD

**DID MSL LAND AT GALE ON MARS
OR VAIL IN COLORADO?**

Pressure like Earth
at 8,192.6 feet
above sea level.

100 Pa = 1 hPa = 1 Mbar.
Sol 29 was first given as 747 hPa, while Sol 30 was given as 747 Pa (7.47 hPa) after questions by us and others

**DAILY WEATHER NEVER
INCLUDES RELATIVE HUMIDITY**

**ALL WINDS (2 M/S) REPORTED
← WRONG UNTIL MAY 2013**

Why Trash Occam?

- **Weather doesn't match low pressure values**
 - Running water
 - Dust Devils
 - Dust Storms
 - Eye walls on huge storms over Arsia Mons
 - Stratus clouds at 16 km.
 - Too much sand movement for low pressure
 - **Light in the sky 1 hr 40 min before sunrise and after sunset. Just due to high dust, or a denser atmosphere?**

Why Trash Occam?

- Viking pressures suspicious due to exact repeat over 4 yrs. Ditto for MSL shown below.

WHY TRASH OCCUM? MRO AEROBRAKING

*"At some points in the atmosphere, we saw a difference in the atmospheric density ... 30% higher than the model, but ...
around the south pole
it was 350% off the model."*

Han You,
Navigation Team Chief for
Mars Reconnaissance Orbiter (MRO).

Why Trash Occam?

Mars Express spacecraft reveals Mars air is supersaturated with water vapor (29 Sep 2011).

10 to 100 times more H₂O than expected at 20 to 50 km. Partial pressures imply denser air too.

Since then running water has been found at many sites on Mars on 28 Sep 2015.

WHY TRASH OCCAM?

MGS Dynamic Pressure Spike @ 75 mile altitude
Due to Dust Storms.

Pressure Doubles in 48 Hours, Up 5.6 Fold in 4 Weeks.

Why Trash Occam?

- **Pathfinder wind sensors went uncalibrated.**
 - True again with MSL.
- **Phoenix & MSL pressure sensor design problems. FMI delivered the MSL pressure sensor to NASA in 2008 (before ITAR problems could be fixed)!**
<http://space.fmi.fi/solar.htm>
- **No pressure sensor sent to Mars could measure pressure that would explain the weather seen.**
- **No way to change Viking, MPF, Phoenix & MSL dust filters that could clog.**

There is an issue with which Tavis Pressure Transducers were actually sent to Mars.

The sensor labeled Tavis Dash No. 1 could Measure Earth-like Pressure! (1,034 mbar)

**UNCONTROLLED COPY
SUBJECT TO REVISION**

(0 to 1,034 mbar) 0-15 PSIA

(0 to 12 mbar) 0-0.174 PSIA

For Pathfinder, the 0.174 PSIA is believed to be what was sent. The 15 PSIA transducer is good for Earth-like pressures - but why was it ordered?

**Are JPL errors mistakes; or is NASA putting off
manned missions to Mars to hide the truth about
Cydonia, where the famous "face" was clearly
seen by a Viking orbiter in 1976, but not later?**

Highest-Resolution View of "Face on Mars"

MGS MOC Release No. MOC2-283, 24 May 2001

Do radioactive sites on Mars = Disinformation?

Radioactive Potassium - 40 (Percentage by Mass)
(half-life = 1.251 billion years)

Lyot impact crater at 50 North, 29.3 East (330.7 W) is where Brandenburg thinks an asteroid hit that destroyed Martian oceans.

Radioactive Hot Spots

Distribution of radioactive potassium on Mars

Adapted from Brandenburg, 2011 to relate radioactive hot spots to landers that had meteorology instruments, Cydonia "face" and geographic landmarks.

Thorium-232 (part per million)

(half-life = 14.05 billion years)

Radioactive Hot Spots

1976 Viking view

2001 MGS view

Distribution of Thorium on Mars

1976 Viking view

Why did NASA Administrator James Fletcher order the alteration of Martian sky color in 1976?

- ❖ Every picture of Mars sky color was wrong for 36 years after his order until MSL in August 2012.
- ❖ He kept our astronauts in low orbit to this day.

The Cydonia face is an issue, the nuclear past is questionable, but evidence for much higher pressure and sloppy handling of Mars weather data is irrefutable.

CRATER LAKE, OREGON
(Maximum diameter = 9.7 km,
Maximum depth = 594 meters,
average height of rim above
lake = 305 meters)

VASTITAS BOREALIS, MARS
(Maximum width = 35 km)
Imaged centered at 70.1° North latitude,
103.21° East longitude

Mars is more like Earth than we have been told.
