

ANNEX S TO
MARS CORRECT: CRITIQUE OF ALL NASA MARS WEATHER DATA
Two Martian Years of MSL High Air and Ground Temperatures

This Annex documents all Mars Science Laboratory (MSL) high air and ground temperatures weather data for MSL's first two Martian years on the planet (1,338 sols). It also reveals what the Roffman Team sees as temperature anomalies, and how the REMS Team and JPL altered their data after we color-highlighted what was off the expected temperature and pressure curves.

Revisions and Inconsistent High Air and Ground Temperatures Call MSL Temperature Data into Question. Updated on May 16, 2016.

On September 29, 2015 NASA's Jet Propulsion Agency announced that they had found evidence of thousands of running (briny) water streams on the surface of Mars. While not yet confirmed, JPL (<http://www.americaspace.com/?p=86717>) let us know that, "Dark streaks seen on the slopes of Mount Sharp in Gale crater may also be RSL. It was noted in the press conference, but that hasn't been confirmed yet, and if they are, it's still unknown whether the Curiosity rover could get close enough to study them." JPL made a major effort to use the presence of perchlorates to explain how running water could be found on the surface of such a cold planet with such low atmospheric pressure. We vigorously challenge their air pressure contentions throughout this site, but with respect to the temperatures as is shown on Tables 1 and 2 below, the high ground temperatures and to a lesser degree the high air temperatures where the Mars Science Laboratory (MSL) roams at Gale Crater are often above the freezing normal point of water freezing. All such on Table 2 **temperatures at MSL that are above 0° C are indicated with bold red fonts**. Table 2 shows the first Martian year (669 sols) on the left and the on-going second Martian year on the right side. Columns J and K show changes in high temperatures between the first and second years. If Mars had no atmosphere we would expect to see little change between the two years on sols that are at the same solar longitude (Ls). The more the variation the more it appears that the atmosphere is dense enough to bring about significant variation in weather. Further explanation of Table 2 is found below the Table. A calculator to convert Earth to Mars dates and to find the dates of Mars at various solar longitudes may be found at http://www-mars.lmd.jussieu.fr/mars/time/martian_time.html. MSL will complete its second Martian year on May 11, 2016. We plan on presenting a very detailed analysis of how the two years differed from each other at that time.

The Temperatures Involved: Here is data that we gathered and placed in our article: **As of May 14, 2016 (two full Martian Years) it appears that the high air or ground temperature is above 0° C at Gale Crater on 411 days of the 669 sols in a Martian year.** This number surprisingly increased in early winter of **MSL Year 2** on 16 sols between Ls 95 and 104 with above freezing ground temperatures of **+1, +1, +2, +1, +1, +1, +1, +1, +1, +2, +2, +2, +3, +1, +2 and +1 °C** found where in **Year 1** the ground temperatures on those days were **-7, -6, -3, -6, -5, -9, -11, -8, -8, -13, -7, -7, -8, -8, -10 and -9° C**. There were also five sols (1222, 1223, 1230, 1237 and 1244) at Ls 94, 98, 101 and 104 where **the ground temperature in Year 2 was 0° C while in Year 1 it was only -10, -7 -5, -9 and -10° C**. A quick summary for this 24-sol period each year is as follows:

TABLE 1

**USUALLY WARM GROUND TEMPERATURES EARLY IN THE WINTER OF MSL
YEAR 2**

Msl Year	Ls Range	Sol Range (24 Sols)	Average Day Air Temp Hi ° C	Average Night Air Temp Lo ° C	Average Drop In Air Temp Day To Night	Average Day Ground Temp Hi ° C	Average Night Ground Temp Lo ° C	Average Drop In Ground Temp Day To Night
1	93 TO 104	552 TO 575	-26.66667	-84.9583	-58.2916	-8.45833	-90.79167	-82.3233
2	93 TO 104	1,221 TO 1,244	-26.79167	-87.45833	-60.6666	+0.79167	-96.54167	-97.3333

MARS SCIENCE LABORATORY HIGH AIR AND GROUND TEMPERATURES

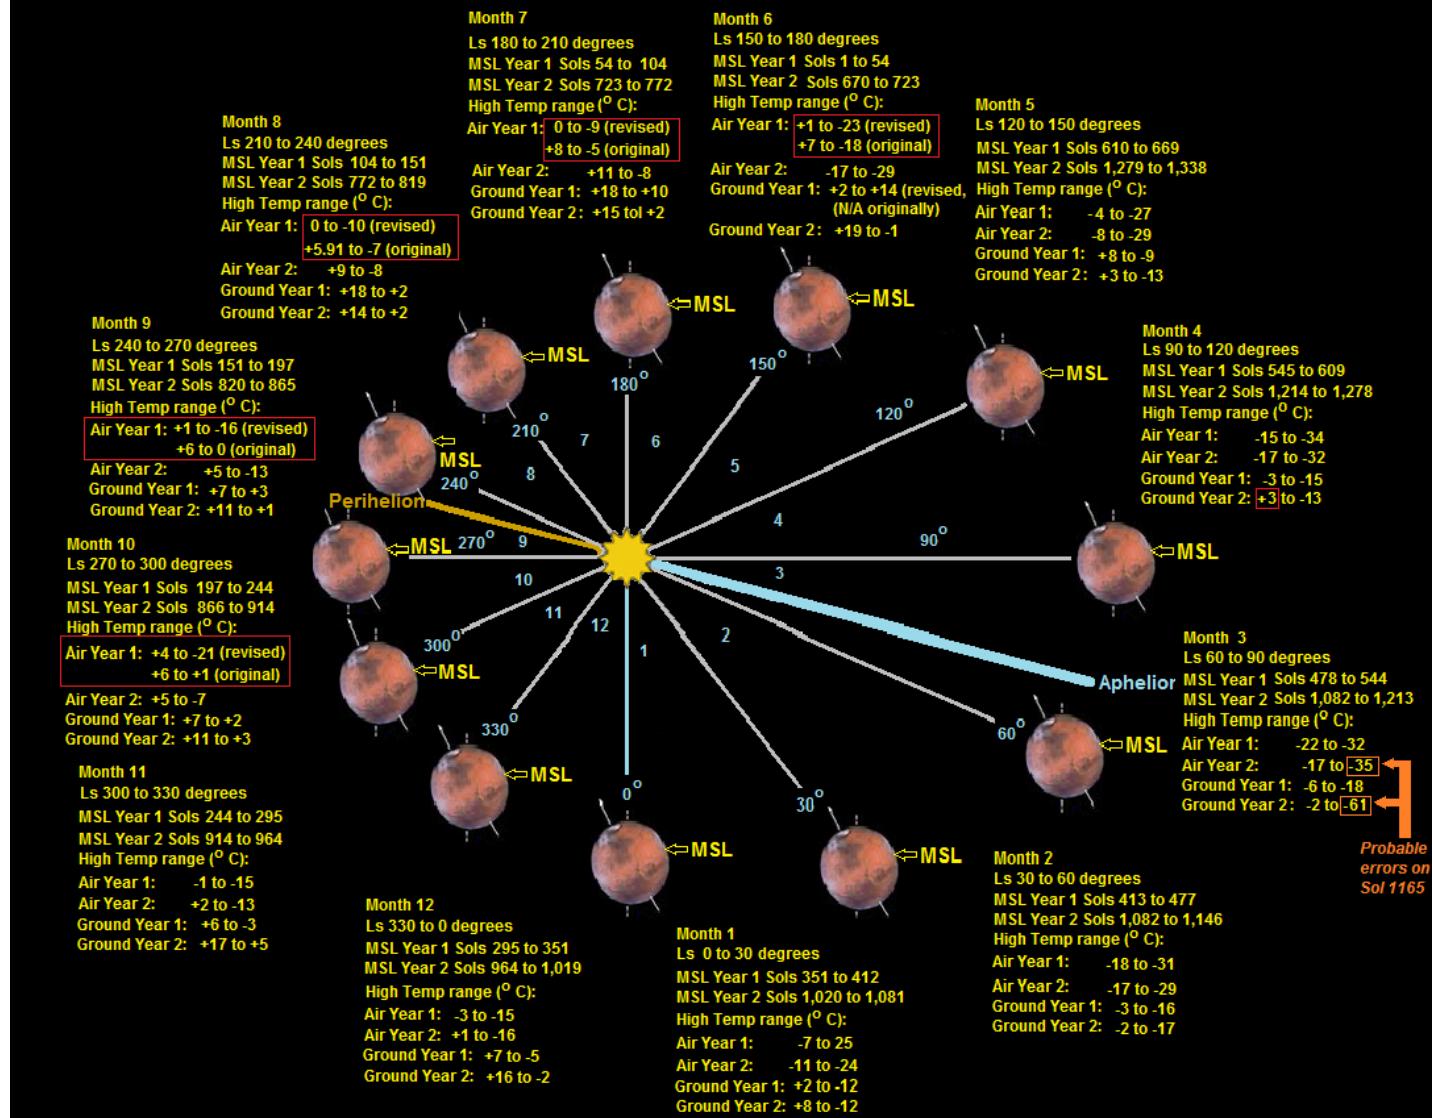

Figure 1 above - Range of high air and ground temperatures through MSL Years 1 and 2.

On Table 2 column subjects and color codings are as follows:

Column A (Sol) for MSL Year 1. The Martian day is about 39 minutes longer than the terrestrial day.

Column B is solar longitude (Ls) for MSL Year 1. MSL is in the Southern Hemisphere on Mars. The landing was at Ls 150 in winter. Ls 180 begins the spring there. Ls 270 starts summer, Ls 0 starts the fall. Ls 90 starts the winter.

Column C shows the maximum air temperature MSL Year 1. **Temperatures above 0°C are shown with red bold fonts.** With respect to the freezing point, from 0° C at 1 atm pressure it will increase up to 0.01° C at 0.006 atm (which is about the average pressure on Mars as given by NASA). This is the triple point of water. At pressures below this, water will never be liquid. It will change directly between solid and gas phase (sublimation). The temperature for this phase change, the sublimation point, will decrease as the pressure is further decreased

Column D shows original maximum air temperature for MSL Year 1. **Temperatures above 0°C are shown with red bold fonts.** A serious issue here is that JPL took so long to revise the temperatures that it allegedly found at Gale Crater that they raise serious questions about the quality of any temperature instruments sent to Mars. In general when maximum temperatures were far above the freezing point of water, JPL knocked them down. It's also true that JPL added 4 or 5 °C between sols 10 and sol 443 (August 16, 2012 to November 3, 2013. All the temperature data appears to have been artificially manipulated. See Table 1 at [MSL Year 1 Mars Weather Data and Data Revisions](#).

Column E shows maximum ground temperature. **Temperatures above 0°C are shown with red bold fonts.** As with terrestrial deserts, the ground on Mars heats more during the day than the air does, and it cools more at night than the air does.

Column F (Sol) for MSL Year 2.

Column G is solar longitude (Ls) for MSL Year 1.

Column H shows the maximum air temperature MSL Year 2. **Temperatures above 0°C are shown with red bold fonts.**

Column I shows maximum ground temperature MSL Year 2. As with terrestrial deserts, the ground on Mars heats more during the day than the air does, and it cools more at night than the air does. **Temperatures above 0°C are shown with red bold fonts.**

Column J shows the change in high air temperatures for the same Ls between MSL Years 1 and 2. The hypothesis is that where there is little or no air (like on the Moon) temperatures at the same LS should be extremely similar between MSL Years 1 and 2 unless there is a significant increase or decrease in energy coming from the sun.

Column K shows the change in high ground temperatures for the same Ls between MSL Years 1 and 2. The hypothesis is that where there is little or no air (like on the Moon) temperatures at the same LS should be extremely similar between MSL Years 1 and 2 unless there is a significant increase or decrease in energy coming from the sun or unless there are significant differences in the nature of the rock or soil (or what is under the soil, such as briny water) being exposed to the sun. Great differences may be used to detect certain substances (like water). There is some indication that running surface water from RSL may exist at Gale crater, but it is not yet certain that MSL will confirm this by going there.

RECORD WARM HIGH DAY WINTER GROUND TEMPERATURES FOR MSL SOLS 1234 TO 1241 - ALONG WITH RECORD LOW NIGHT GROUND TEMPS

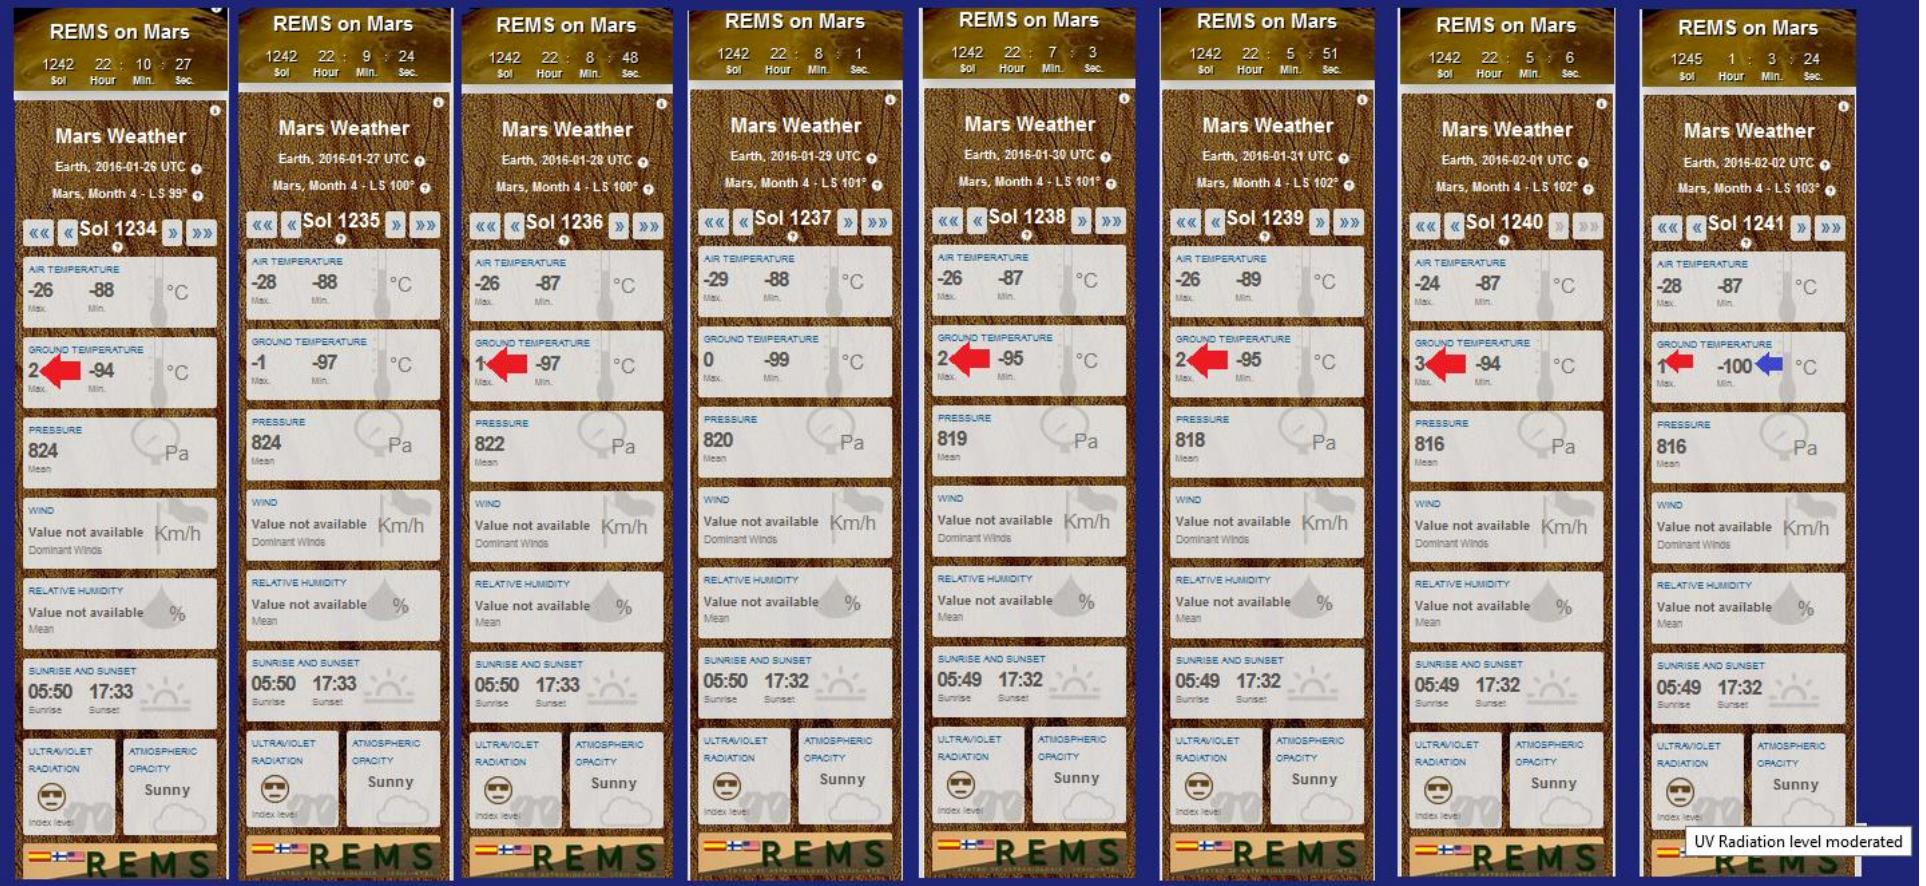

Figure 2: REMS weather reports published for MSL Sols 1234 to 1241. Note all the ground temperature highs above 0 degrees Celsius and the incredibly low ground temperature at night - down to -100 degrees Celsius on Sol 1241. We think this is evidence for broken ground temperature sensors, or failure to factor in the very poor accuracy of the ground temperature sensor (10K/10 degrees Celsius/18 degrees Fahrenheit).
