

ANNEX H
to
CRITIQUE OF ALL NASA MARS WEATHER DATA, WITH EMPHASIS ON PRESSURE:
Calibration Efforts for the Mars Pathfinder Tavis Pressures Transducer and
IMP Windsock Experiment:

Unlike the earlier Annexes of this report that highlighted an audit of Viking pressures and instrumentation sent to Mars, this Annex focuses on Pathfinder. It quotes verbatim the NASA Planetary Data System with respect to problems encountered during calibration of the Pathfinder Tavis Pressure Sensor. It then reformats data dealing with attempts to calibrate a set of three windsocks on the Imager for Mars Pathfinder (IMP) sent to Mars aboard the Pathfinder.

1. Calibration Efforts for the Mars Pathfinder Tavis Pressures Transducer. While the following text does not prove that the MPF transducer was broken beyond repair before it was even sent to Mars, it does indicate that there were concerns about its accuracy. These concerns are not related to dust clogging the air tube or pressure filter, but they do indicate that the pre-launch care assigned to the transducer was far from optimal. The text is taken from http://starbrite.jpl.nasa.gov/pds/viewInstrumentProfile.jsp?INSTRUMENT_ID=ASIMET&INSTRUMENT_HOST_ID=MPFL:

*“The Tavis pressure sensors used by ASI/MET are sensitive to temperature and must be calibrated to correct for this dependence. **During pre-launch calibration, both the flight and flight spare pressure sensors were inadvertently exposed to temperatures 30 K below their design limits.** This produced changes in sensor offset of several tenths of a mbar, and increased the variation of offset with temperature by a factor of 7 relative to the original calibration. These changes were not noticed until spacecraft thermal vacuum*

testing and by the time they were understood, it was too late to procure new sensors. It was therefore decided to fly the flight sensor and use cruise phase health check measurements to calibrate the temperature dependence of offset.

As sensor gain calibration was not possible during the mission, it was assumed the gain had not changed. Limited pre-flight measurements and more extensive calibration of the flight spare sensor suggested that the effects of gain changes on pressure measurements at 7 mbar were 6-8 times smaller than those of offset changes.

During the nominal landed mission, the ASI/MET pressure sensor experienced diurnal temperature variations of 265-300 K. These introduced large, spurious, components to the diurnal pressure cycle, due to the temperature variation of sensor offset, which had to be removed using calibration data. In cruise, it was only possible to calibrate flight sensor pressure offset in the 270-280 K temperature range. These data indicated a temperature dependence of -0.019 mbar/K. This was the temperature dependence assumed in [SCHOFIELDETAL1997].

However, after the mission, the offset calibration was revisited. It was found that the cruise offset measurements were influenced by long term changes (over 6 months) as well as temperature dependent changes. Offset measurements over the 270-280 K range made during the 90 minutes before entry eliminated the long term drift and indicated a temperature dependence of -0.0135 mbar/K - a smaller dependence than the cruise offset measurements.

Late in the landed mission when the spacecraft was off overnight and took data only during the day, the sensor temperature and measured pressure cycles were observed to be very similar from day to day (with the exception of the slow seasonal increase in pressure). However, during the four 24 hour, 4 second sampling sequences (sols 32, 38, 55, and 68), pressure sensor temperatures often differed by 15 K for the same time of day. This is because at the beginning of the sequence the spacecraft had been off all night, while at the end of the sequence it had been on all night. The -0.019 mbar/K temperature coefficient did not produce repeatable pressure cycles under these conditions but the -0.0135 mbar/K coefficient did, providing additional support for the pre-entry result. The pressure cycle data also suggested that this offset coefficient was valid over the 260-310 K temperature range.”

2. Calibration Efforts for the Mars Pathfinder Tavis Pressures Transducer and IMP Windssock Experiment.

The data below was obtained from simulations on Earth. To read about what actually happened when the IMP reached Mars, see Sullivan, R., et al. (2000) at <http://www.lpi.usra.edu/meetings/lpsc2000/pdf/1853.pdf>. There was an unfortunate lack of wind for much of Pathfinder’s short life. The lander only encountered significant winds on its sols 13, 50, 52, and 58. Of these sols, MPF pressures were only available for sol 13. There was no anemometer on Phoenix, and MSL’s Boom 1 with a hot-wire anemometer failed when it was struck with a rock during landing. This means that effectively only the Vikings provided meaningful wind data.

The Pathfinder data below is taken from http://starbrite.jpl.nasa.gov/pds/viewInstrumentProfile.jsp?INSTRUMENT_ID=WINDS

[OCK&INSTRUMENT_HOST_ID=MPFL](#).

Note that two thirds of the calibration efforts were for terrestrial pressure of 1,015 mbar while the remainder was at ~15 mbar, and **no intermediate pressures were considered or tested that might represent dust storms.** On the pages to follow, all Earthlike pressures are on the left in blue, Mars-like pressures are on the right in Orange. The data selected was:

AZ = Strut Azimuth: Strut azimuth of 0 deg extends the windssock strut ahead of the mast, into the wind; 180 deg azimuth extends the windssock strut directly downwind of the mast, placing the windssock in the mast wake. Strut azimuth increases clockwise when viewed from overhead.

Date and time of exposure of windssock picture.

T = Temperature (K): Approximate temperature of the atmosphere

P = Pressure (mb): Atmospheric pressure in millibars. Pressures for one-atmosphere exposures are approximated as 1015 mb.

FS = Fan Speed (Hz): For one-atmosphere exposures only, the speed setting of the wind tunnel fan.

U = Wind Speed (m/s): Wind speed in meters/second recorded by the laser-Doppler velocimeter.

DA1=Deflection Angle (deg) of the windssock from vertical measured from picture.

DA2 = Deflection Angle (trial 2) (deg): A second trial measurement, from the original film, of deflection of the windssock from vertical.
